**Prepared By:** David Haynes

**Copies:** File

**Date:** July 27, 2017

**Subject:** Scholls Heights at South Cooper Mountain  
Landscape Architect's Note for Trees to be  
Preserved

**Project No.:** 17480

To preserve trees in the SNRA during new construction methods should include a silt fence surrounding the areas as well as TPF (tree protection fence). The silt fence will be particularly important in stopping erosion and run-off from entering the protected area during the grading of surrounding areas.

The grade and landscape within the driplines of the protected trees should remain in its natural state. This will preserve the soil health within the stand and buffer the larger trees from the impacts of new construction. This would include understory trees and shrubs, leaf litter, and woody debris. These should all remain within the preserved area where it is feasible.

Where grading and excavation activities are to be performed within the driplines of protected trees, a certified arborist shall be onsite to supervise construction activities within the root zones. The arborist will be prepared to prune roots where needed, make recommendations, and report on the impact of construction on specific trees. Additional tree preservation methods may be suggested during excavation and grading.

Specific trees, or groups of trees of concern, shall be identified during the grading process and treatments will be recommended at that time. These treatments can include but are not limited to: temporary irrigation, mycorrhizal applications, additional mulch, pruning, and soil amendments.

The attached extended tree list supplements the tree plan drawings. Additional information includes condition, the tree's status and DBH as a community tree or SNRA tree, and, for the SNRA trees, whether the tree will be removed and the DBH of removed trees.

David Haynes, PLA
